

Relationship of Black Hole to Host Galaxy: Properties and Evolution

Karl Gebhardt, The University of Texas at Austin

Abstract: The amount of data archived or planned for black hole studies offers an enormous opportunity to fully characterize their relationship to the host galaxy. I will review the present observations and discuss their implications. We are now also able to obtain redshift information for these relations, allowing us to watch how they develop and evolve. I will discuss the evolution of black hole growth relative to the growth of the galaxy.
